

School Quick-Start Guide

Your first week with the system, day by day

School Management Platform

School Quick-Start Guide — First Week With the System

"What should we do first?" This sequence follows the platform's actual dependencies — each day's work builds on what you set up before it. It assumes your School Admin account is already created and you can log in. For full detail on any step, see the [School Administrator Manual](#).

Skipping ahead is possible but not recommended — e.g. you cannot enroll a student before a level exists, and you cannot take attendance before students are enrolled.

Day 1 — Login & foundation

Goal: your school "exists" in the system with a working academic structure.

1. **Log in** with the account/credentials given to you.
2. **School configuration** — go to **School settings**: - **Profile** tab: fill in contact email/phone, address. - **Branding** tab: upload your school logo (used on printed report cards later). - **Regional** tab: set your timezone, currency, and date format. - **Modules** tab: review what's on by default and switch on anything you know you'll need this week (e.g. **Timetable** or **CBT** if you plan to use them — they're off by default).
3. **Academic setup**: - **Academic** → **Sessions**: create your current academic session/year, mark it **current**. - Click **Terms** on that session → add your term(s). - **Academic** → **Levels**: create every class/year group your school has. - For each level: open **Arms & subjects** → add arms/streams if you use them, and tick which subjects each level offers (create subjects first under **Academic** → **Subjects** if you haven't).

By end of Day 1: your school has a name, a logo, a current session and term, and a full list of classes and subjects.

Day 2 — People

Goal: your staff and students exist in the system, and are placed in classes.

1. **Teachers** — go to **Teachers** → **Add teacher** for each staff member. Add their **teaching assignments** (which class + subject each one teaches) from their profile — this is what scopes a Teacher-role user to their own classes later.
2. **Students** — go to **Students** → **Add student** for each student (or batch through them one at a time — there is no bulk import in this version). For each one, open their profile → **Add enrollment** to place them in a class.

3. **Guardians** — go to **Guardians** → **Add guardian**, then link each one to their child(ren) from the student's profile.

By end of Day 2: every teacher, student, and guardian exists, students are placed in classes, and teachers know which classes they teach.

Day 3 — Classroom operations

Goal: prove the daily-use features actually work.

1. **Timetable** (if you enabled it Day 1) — build at least one class's weekly schedule and **publish** it.
2. **Attendance** — as a Teacher (or School Admin), create a register for a real class and date, mark it, and **Save & submit** — confirm it locks correctly.
3. **Assessments** — under **Assessments** → **Categories**, set up your categories (e.g. Classwork, Test, Exam) if you haven't already. Create one real assessment, enter scores, **Publish**, and **Lock** it.

By end of Day 3: you've proven a Teacher can take attendance and enter scores for a real class.

Day 4 — Money & communication

Goal: fees are configured and staff can log parent communication.

1. **Fees** — go to **Fees** → **Categories**, add your fee types. **Fees** → **Fee structures** → **Create** to set the amount(s) for this term/level. Raise a real charge for at least one student and record a test payment to confirm the workflow end-to-end.
2. **Communication** — confirm the **Notifications** module is on. Log a test communication thread, and publish a test **Announcement** to confirm staff/parents will see it.
3. **Learning materials** (if you enabled it) — have a teacher upload one real file for their class.

By end of Day 4: money and communication are flowing, not just configured.

Day 5 — Results, assessments to grade, and reporting

Goal: close the loop — prove a result can be produced and reported on.

1. **Results** — under **Results** → **Grading schemes** and **Weighting schemes**, set these up if you haven't. Create a result run for a class with locked, published assessments, **Compile** it, walk it

through **Mark reviewed** → **Approve** → **Publish** → **Lock**, and open a report card to confirm it renders correctly with your logo.

2. **CBT** (if you enabled it) — create one real examination, add questions (or pull from the Question Bank), **Schedule** it, and have a test student account sit it to confirm the whole flow.
3. **Reports** — visit **Reports** and open a few areas (Academic, Attendance, Fees) to confirm real numbers show up, matching what you entered this week.

By end of Day 5: your school has a complete, real, end-to-end proof that every layer works — structure, people, daily operations, money, and results/reporting.

After week one

- Set up **Member accounts** and roles (§12 of the School Admin Manual) for every staff member who needs to sign in themselves.
- Link guardian and student accounts to their own logins so the **Parent Portal** and **Student Portal** are actually usable, not just configured.
- Review the **Training Handover Checklist** with your trainer/salesperson to confirm nothing was missed.
